## ABSTRACT

A cylindrical body is produced which is composed of a fiber structure with a basis weight of  $1-50~\mathrm{g/m^2}$  and having a diameter of  $0.5-50~\mathrm{mm}$  and a bellows-shaped section, wherein the crest-to-crest spacing of the bellows-shaped section is no greater than 2 mm and the crest-to-valley depth of the bellows-shaped section is  $0.01-1~\mathrm{mm}$ ; collagen is added to the cylindrical body to produce a composite comprising the cylindrical body and collagen.
